

QuickRuit — Full Introduction

A single reference document covering QuickRuit's origin, vision, product, positioning, business model, and pitch. Written to be understood equally well by a human reading it once, or an AI model using it as context.

1. Origin Story — Why I Built QuickRuit

QuickRuit didn't start with domain expertise. It started with a question.

During his fourth semester, founder Rahul Shrivastwa was actively applying for internships — building profiles on LinkedIn, Internshala, Naukri, optimizing his resume, emailing HRs, applying to hundreds of opportunities. He wasn't a topper, but he was a solid candidate: 80-85% scores, real projects, relevant skills. Yet many applications went unanswered.

At first he assumed the problem was competition. Then he looked at it from the other side: if he was applying to hundreds of jobs, recruiters were receiving thousands of applications for each one. A single recruiter had to review resumes, compare profiles, schedule interviews, and repeat the same screening questions over and over, trying to find the right few people in an overwhelming pile.

The question changed from *"Why am I not getting selected?"* to *"How does a recruiter find the right candidate among thousands of applications?"* — and then to: *What if recruiters didn't have to start with thousands of resumes? What if they could start with the top 5% most relevant candidates instead? What if communication, practical understanding, and role fit could be assessed automatically, before a recruiter even opened the first application?*

The real problem wasn't a shortage of talent. It was **filtering talent at scale** — and the first round of hiring was still almost entirely manual, on both sides of the table. That insight became QuickRuit.

2. Vision & Mission

Vision: AI handles the first round. Humans handle the final decision.

Mission: Remove the repetitive, manual first-round work in hiring — resume filtering, scheduling, repeating the same screening questions — so recruiters spend their time on what actually needs human judgment: relationship-building and final hiring decisions.

QuickRuit does not aim to replace recruiters. It aims to remove the operations that shouldn't require a human in the first place.

3. The Problem

- A single job opening in India can receive 300-500 applications within days; usually only 15-20 of those are genuinely relevant.

- Recruiters still manually review nearly every profile — 100% human effort for roughly 20% useful candidates.
 - Recruiters report spending 20-30 hours screening candidates for a single role.
 - Traditional ATS platforms store and organize resumes, but do not evaluate candidates — they solve storage, not filtering.
 - Resume claims are self-reported and unverified; a meaningful share contain misleading or inflated claims, and recruiters still have to manually verify everything.
 - The underlying problem isn't a shortage of candidates. It's that companies have no fast, scalable way to know who is actually capable **before** committing recruiter and hiring-manager time.
-

4. What QuickRuit Actually Is (Positioning — Final, Locked)

Do not describe QuickRuit primarily as: a resume screening tool, a sourcing platform, a job board, a traditional ATS, or a generic "AI-powered hiring platform." These are either what QuickRuit is *not*, or phrases so overused by every competitor that they carry no meaning anymore.

The core mechanism: A resume is a claim. A single interview is mostly a guess. QuickRuit generates **evidence** instead — through adaptive assessments, dynamic AI interviews, and (for technical roles) coding/reasoning rounds — and compiles all of it into one explainable scorecard before a recruiter ever schedules a call.

The core outcome (what people actually want, and what should lead every pitch): Recruiters get a trustworthy shortlist in hours instead of weeks, because AI does the repetitive first-round work.

Rule for every pitch, deck, or landing page copy: lead with the outcome (time saved), back it with the mechanism (evidence-based, not a black box). Neither alone is enough — "automation" alone is generic and every competitor says it; "evidence" alone is abstract without the time/effort payoff attached.

Final one-liner (locked):

"AI screens, tests, and interviews every candidate — so HR gets a trustworthy shortlist in hours, backed by evidence, not a black-box score."

Positioning stack:

CATEGORY: Candidate Evidence Platform (internal/investor framing — don't over-repeat as jargon on the website)

ONE WORD WE OWN: Evidence

CORE PROMISE: Recruiters see proof of what a candidate can do, not just what they claim

DIFFERENTIATOR: Aptitude, adaptive assessment, dynamic interview, and coding all feed ONE continuous evidence chain into one scorecard — not isolated test scores
the way competitors' separate tools do

WORKFLOW: Resume → Assess → Adapt → Interview → Challenge → Evidence → Recruiter Decision

OUTCOME: The final interview becomes a confirmation, not a discovery

5. The Product — What QuickRuit Does

Current workflow (as it exists today)

1. **Job creation** — company creates a job opening / job description.
2. **Resume parsing & matching** — AI parses resumes and evaluates candidates against the role using skills, experience, and (for technical roles) live GitHub/LeetCode data.
3. **Async AI video interview** — candidates interview anytime, from any device, no scheduling coordination needed. This removes a major operational bottleneck for both sides.
4. **AI evaluation** — while/after the interview, AI evaluates communication, technical understanding, and behavioral signals.
5. **Explainable scorecard** — instead of a raw, unexplained number, QuickRuit generates a scorecard recruiters can actually read: why a candidate scored high, where they were weak, backed by transcript/evidence.
6. **Recruiter decision** — the recruiter reviews the ranked, evidence-backed shortlist and makes the final call. QuickRuit does not make hiring decisions.

Product modules (be honest about maturity — do not present all of these as equally finished)

- **Aptitude assessment** — initial reasoning/aptitude evaluation layer.
- **Adaptive technical/role assessment** — difficulty adjusts based on candidate performance (stronger candidate → harder questions); multiple question formats (MCQ, multi-select, fill-in-the-blank, one-word, written). Currently strongest for technical roles.
- **AI video interview** — currently more structured/static; the product direction is toward fully dynamic interviews where the AI asks real follow-up questions based on the candidate's previous answer, rather than a fixed script. This is a near-term differentiator, not yet fully mature for every role type.
- **Coding/technical round** — coding assessment today; the roadmap direction is an AI-assisted coding interview that evaluates reasoning and process, not just final output, without becoming a tool that helps candidates cheat.
- **Bulk screening** — employer uploads many resumes at once; AI parses, scores, and ranks against the JD.
- **Campus Drive Mode** — bulk assessment mode built for university placement drives.
- **Anti-cheat / proctoring** — signals like tab-switching, gaze deviation, and script-reading detection to protect interview integrity.

Honest gaps (say this clearly, don't hide it)

- **ATS integration is not built yet.** It is on the roadmap, not a current feature. Never present it as available today, in a pitch or on the website — say "coming soon" / "on our roadmap" explicitly.
- Non-technical role evaluation (sales, ops, HR, finance) is a real direction but not equally mature as technical roles yet; the honest current strength is technical and select knowledge-based roles.

6. Why Us — Differentiation vs. Competitors

QuickRuit does not compete with sourcing tools (LinkedIn, Naukri) — those bring candidates *in*. QuickRuit sits at the next step: evaluating who's actually worth a recruiter's time, before the recruiter opens the first resume.

Competitor	What they actually do	Where QuickRuit differs
------------	-----------------------	-------------------------

HireVue	Large global enterprise AI video interviewing + skill validation suite. Deep ATS integrations (Workday/SAP/Oracle), FedRAMP-certified.	Priced far out of reach for QuickRuit's target buyers (~\$35K+/year minimum); long sales cycles, heavy/legacy feel. QuickRuit is self-serve, affordable, India-first.
HirePro	India's established enterprise/campus hiring platform (20+ years old, part of the Careernet group). Strong in proctoring and large campus drives, services-heavy.	Enterprise-only, services-led, doesn't serve staffing agencies or SMEs. Legacy tech stack/UX vs. a modern product.
Spark Hire	US-based, SMB-focused video interviewing + ATS bundle. Transparent modular pricing (~\$249-499/month).	Mostly a recorder + manual human review at scale — no deep dynamic AI interviewing. US-only, USD-priced, no India presence.
avua	AI hiring + Employer-of-Record/payroll platform for global contractor hiring.	Different buyer entirely (contract/gig hiring, not full-time recruiter workflows) — not really a direct competitor.
TurboHire	India-based, enterprise-focused "hiring intelligence" platform, has raised funding.	Enterprise-only, high minimum ticket (~₹50,000+/month) — doesn't serve SMEs/staffing agencies/campuses at India-affordable pricing.
ConverzAI	Targets US staffing agencies with AI-agent-led conversations.	No India product presence; different geography and buyer motion.

The structural gap nobody fills: Assessment tools only assess. Interview tools only interview. Coding platforms only test code. Nobody chains aptitude → adaptive assessment → dynamic interview → coding into **one continuous evidence record** feeding a single explainable scorecard — and nobody does it at India-affordable, self-serve pricing for staffing agencies, SMEs, and university placement cells specifically.

7. Business Model & Pricing

Model: Pay-as-you-grow, usage-based, low friction — no large upfront commitment required.

- **Free pilot** — companies test the product on a real open role before paying anything.
- **Pay-per-interview** — ₹99 per AI interview for startups/SMEs (e.g., 100 candidates ≈ ₹9,900 — less than a week of a recruiter's salary, delivered in ~48 hours instead of weeks).
- **Campus / bulk drives** — flat packs starting at ₹4,999 for university placement drives (500+ students per drive).
- **Unit economics:** Backend (Node.js/FastAPI/Redis, Gemini-based AI) is decoupled and lean — actual per-candidate processing cost is roughly ₹5-10, supporting a high (~80%+) gross margin business at these price points.

(Note: an earlier draft of the pricing also explored flat monthly SaaS tiers — ₹1,999 / ₹4,999 / ₹9,999 per month. The usage-based, pay-per-interview + campus-pack model above is the current locked direction per the latest

pitch script; if the tiered model is revived later, only one model should be presented publicly at a time to avoid investor/customer confusion.)

Who pays, for what:

- Startups/SMEs & staffing agencies → pay per interview credit, scaling with hiring volume.
 - Universities/TPOs → pay per placement drive, evaluating hundreds of students at once.
 - Corporate HR (later stage) → higher-volume usage or negotiated packages as needs grow.
-

8. Go-To-Market — Segment by Segment

QuickRuit serves three segments that share the same underlying question — *"is this person actually ready for this opportunity?"* — with different entry points and outputs:

- **Corporate HR (B2B):** Candidate → Evidence → Shortlist. Reduce manual first-round workload, give recruiters an explainable, defensible shortlist.
- **Staffing/recruitment agencies (B2B):** Large candidate pool → Evidence → Ranked, client-ready candidates. Agencies can hand clients evidence, not just a name, which reduces client rejection rates.
- **Universities / campus placement cells (B2B2C):** Student pool → Assessment → Skill-gap → Job-readiness insight. The university/TPO is the buyer; students are the end users being evaluated.

Go-to-market motion:

1. Product-led growth via free pilots — let hiring teams experience the time savings directly before paying.
 2. Direct B2B outreach to startup/SME HR teams and staffing agency owners.
 3. TPO and university partnerships for campus placement drives.
-

9. Traction (Say Only What Is Real — Do Not Inflate)

- Product is functional and in active pilot demos with recruiters; not yet fully commercially launched, no revenue yet as of the last recorded state.
 - In a recent 30-day window: 291 unique website visitors and 2,550+ search impressions, with zero paid acquisition spend.
 - 40+ professional validation conversations conducted (recruiters, HR professionals, founders, university placement teams).
 - 5 HR professionals independently discovered the product and requested live demos — fully inbound, unprompted interest.
 - Real conversations directly shaped product decisions (e.g., adding anti-cheat proctoring and Campus Drive Mode came from user feedback, not guesswork).
-

10. Team

- **Rahul Shrivastwa** — Founder, handling vision, execution, and product/technical build. Final-year engineering student. Built the first version of QuickRuit solo, then validated it directly with 40+ recruiters, HR professionals, and university placement teams.
- **Madhav** — handles the technical product build alongside Rahul.

(Note: an earlier team configuration included a second co-founder, Purnima, in a CEO/business role; per later conversation, that arrangement did not proceed and the current team reflected in the most recent materials is Rahul + Madhav. Keep all external-facing materials — YC applications, deck, website — consistent with whichever team configuration is currently accurate before sending anything out.)

11. Roadmap — Be Ruthless About What's Real

NOW (built or near-built):

- Resume parsing/JD matching, bulk screening
- Async AI video interviews (structured)
- Explainable scorecards
- Anti-cheat proctoring
- Campus Drive Mode
- GitHub/LeetCode live verification (technical roles)

NEXT:

- Fully dynamic AI interviews with real-time follow-up questions based on candidate answers
- Expanding evaluation quality for select non-technical, knowledge-based roles (sales, ops, finance) using scenario-based objective questions — not personality/culture-fit inference
- AI-assisted coding interview that evaluates reasoning, not just final code output

LATER:

- ATS/webhook integrations (explicitly not built yet — always disclose this honestly)
- Broader non-technical role coverage
- Candidate-side products (QuickPrep for interview prep, QuickApply for AI-assisted applications)

DO NOT BUILD (for now):

- Full onboarding/offer-letter/document-collection suite (deliberate scope discipline — QuickRuit owns the first round, not the entire hiring lifecycle)
 - Personality/culture-fit prediction from video (legally risky territory — this is exactly what got HireVue into regulatory trouble; avoid it)
 - A generic all-roles-day-one launch (spreads focus too thin before the core evaluation engine is proven)
-

12. Pitch Lines — Ready to Use

30-second version, for an HR person (Hinglish):

"Resume se sirf ye pata chalta hai ki candidate kya bol raha hai apne baare mein. Interview mein bhi aap 20 minute mein guess hi karte ho. QuickRuit candidate ko test karta hai — aptitude, uska actual skill, ek AI interview jo follow-up sawal poochta hai — aur aapko ek report deta hai jisme evidence hai, sirf ek number nahi. Aap dekhte ho candidate ne kya prove kiya, na ki sirf kya claim kiya."

30-second version, for an investor:

"Hiring decisions today are based on claims — a resume, a 20-minute interview. QuickRuit builds an evidence chain instead: adaptive assessment, dynamic AI interview, and coding evaluation, all feeding one explainable scorecard. Nobody in this market chains assessment and interview into one continuous evidence pipeline. That structural gap is our wedge, and it works the same way for corporate HR, staffing agencies, and campus placements — because they're all asking the same underlying question: is this person actually ready for this opportunity?"

Landing page hero:

- Headline: "Resumes tell you what they claim. QuickRuit shows you what they can do."
- Subheadline: "Adaptive assessments, dynamic AI interviews, and coding rounds — compiled into one evidence-backed scorecard, before you schedule a single call."
- CTA: "See the evidence — start free"

Backup lines for Q&A / when impressed:

- "We're not competing with recruiters. We're removing repetitive recruiter operations."
 - "The biggest hiring cost today isn't software. It's recruiter time."
 - "India doesn't need another ATS. It needs a way to know who's actually ready — fast."
-

13. What NOT to Say (Guardrails)

- Do not claim ATS integration exists today — it's roadmap, say so explicitly.
- Do not say "first ever," "no competitors," or "we're replacing recruiters."
- Do not present a single, specific efficiency percentage (e.g., "90% faster") without being ready to explain how it was measured — keep such claims directional and honest.
- Do not blindly answer a technical question you're unsure of — be transparent ("let me confirm the exact number and follow up") rather than fabricating a precise answer on the spot.
- Do not claim features that are still in development as fully live, in any pitch, deck, or website copy.
- Do not build or claim personality/culture-fit prediction from video — legally risky and not part of the current honest product.
